Abstract (en)  
[origin: WO2007028260A1] In order to producing a device (1, 1') for guiding a surgical tool, a support (19, 13) repositionable on a human body is produced. Three-dimensional radiological information delivered by said support (19, 13) and the treatable area (12) of the human body are used for developing a virtual model of the support (19, 13) and the human body treatable area by means of a computer assistance. Said virtual model makes it possible to determine at least one axis (A) and to transfer said axis onto the repositionable support (19, 13), thereby enabling it to be produced directly on a patient's jaw or the model thereof.
