Abstract (en)
[origin: WO2006134250A2] The invention concerns an orthosis comprising a compressive leg part extending upwards from the ankle. The structure of the row of stitches provides for a homogeneous distribution of elastic return forces over the circumference of the orthosis along an outline corresponding to a horizontal cross-section of the limb. The stitch structure and the dimensioning of the leg part are selected so as to apply, over a region (R) included between the ankle and the knee, a therapeutic pressure once the orthosis is pulled on the limb. The average pressure P_c exerted on the central third (RC) of said compression region is higher than both the average pressure P_b exerted on the distal third (RD) and than the pressure P_d exerted on the proximal third (RP) of that same region. P_c , P_b and P_d being the pressures exerted at heights of respective points c, b and d of the Hohenstein model.
