Abstract (en)  
[origin: WO2007020053A1] The invention relates to an evaluating method for identifying streets to drive on, which, for example are subjected to a toll, by means of measured values, for example the position and a driving direction detected by a motor vehicle. Road courses leading to a decision point are recorded in the evaluating device in an exclusive or preponderant manner. Said courses are re-recorded respectively at a distance from the decision point, where the measured values of sensors arranged in a motor vehicle provide at least one unique value situated within tolerances which makes it possible to unambiguously identify one of alternative road courses to drive. The invention makes it possible to reliably identify the roads to drive between those which don't lead to the decision point.
