Abstract (en)

[origin: EP1923129A1] The device has a trough (1) integrating a rotative element (2) that is in the form of sub assembly, where the element generates a descending flux for products in a direction of receptacle (3) which is placed at a base of the rotative element. The receptacle includes a wall delimiting the perimeter and forming a set of recesses (321) through which the products are destined to be passed. An ejector unit inscribed in the perimeter is provided for directing the products towards the recesses.
