Abstract (en)

[origin: EP1923509A1] A temporary floodwall is assembled from sections (20) coupled by link elements (1). The link element has a first clip (2) to a first flexible water-filled barrier section (21), and a second clip (3) connecting to a second flexible water-filled barrier section (22). The first clip is linked to the second clip by a tube. The clips are essentially square in shape. Each clip (2, 3) incorporates a crank handle (14) to wind up the empty barrier. Each clip has an outer margin with a groove that receives a matching beading attached to the barrier bags (21, 22). Further claimed is a process to erect the temporary floodwall.
