Abstract (en)

The invention relates to a carrier element (1), which has a plurality of segments (2), wherein the segments (2) are arranged side by side in a longitudinal direction (L), wherein each segment (2) has a centre region (3) and two side regions (4, 5) extending to different sides (6, 7) from the centre region (3), wherein two adjacent segments (2) are separated by a cut (8) extending substantially along the entire width of the centre region (3) between the segments (2), wherein two adjacent segments (2) are connected by a common strip of material (9) formed by the side region (4, 5) of the two adjacent segments (2) at a first side (6), wherein two adjacent segments (2) are separated by a side cut (10) arranged in the side region (4, 5) of two adjacent segments (2) at a second side (6, 7) opposite the first side (6, 7) and wherein the connection between two side regions (4) and the separation between two side regions (5) are altering from side to side along the longitudinal direction (L) from segment (2) to segment (2). To facilitate the forming of an arch with the carrier element, the invention is characterized in that at least one bore (11, 12, 13) is arranged in the centre region (3) adjacent to the side cut (10) between two side regions (4, 5).
