Abstract (en)
[origin: EP1923736A1] A panel is formed by laminating a pair of substrates with each other. A first seal material is provided on one of the substrates and a second seal material is provided to completely surround the first seal material. The pair of substrates is laminated with each other in a state where a cell space is formed therebetween and the first and second seal materials are sandwiched between the substrates. An inner space of the second seal material containing the cell space is depressurized through an opening provided outside the first seal material and inside the second seal material. A portion where the second seal material is provided is removed so that the cell space formed by the first seal material remains.
