Abstract (en)

[origin: WO2007031866A1] Described herein is an apparatus (9) for reducing rows of products for use in a system for formation of prevalently homogeneous doses of rusks or the like. The apparatus is provided for being installed downstream of conveying means (8), which convey the rusks arranged in a number of rows, a plurality of rusks of one dose belonging to one and the same row. The apparatus (9) has at least two input paths (24a, 24b) that converge into one and the same output path (25). Each input path (24a, 24b) defines a respective surface of advance, prearranged for receiving from said conveying means (8) the rusks (4) of a respective row, the surfaces of advance of the two input paths (24a, 24b) extending at least in part in planes that are different from one another.
