Abstract (en)

[origin: EP1925358A1] The stirring tool has a driving agitator shaft (1) and an end sided single piece fixed rotor disk (2), which has a multiple flow through channel. The gaseous and/or fine-grained components contain a mixture of two components. The flow through channels consists of symmetrically arranged axial drillings (3) and radial or tangential drillings (4). The axial drilling stands in interaction with a radial or tangential drilling in each case.
