Abstract (en)

[origin: EP1925581A1] There is provided a handrail device of an elevator car, in which work performed by the maintenance worker in a stooping posture to prevent the overturn of the handrail device is not needed, which makes the assembling work and storing work easy, and the handrail device can be configured at a low cost. For this purpose, in the lower end portion of a vertical pillar of the handrail device, an upper pin and a lower pin arranged above and below in the assembled state are provided, and also in a connecting portion for turnably connecting the lower end portion of the vertical pillar to the top portion of the car, a guide portion, which engages with one of the upper pin and the lower pin to guide the vertical pillar vertically through a predetermined distance, and a regulating portion, with which the other of the upper pin and the lower pin engages from the upside to regulate the turning of the vertical pillar in the assembled state of the handrail device, are provided.
