Abstract (en)

[origin: EP1925713A1] A laundry drying machine in which a flow of drying air is caused to circulate in a closed circuit comprising a motor fan (5) adapted to move this flow, a drum (1) containing the laundry to be dried with an associated loading door in the closed position, a battery (6) of heaters adapted to heat the flow of air and a condenser (4) adapted to remove the moisture absorbed by the flow as it passes through the laundry disposed in the drum (1) from the flow and in which a flow of cooling air of the condenser (4) is conveyed in a duct (7) provided with a first opening (8) for air intake and a second opening (11) for discharge, both openings communicating with the environment outside the laundry drying machine, a section (7a) which surrounds the condenser (4), means (9) for regulating the rate of the flow passing through the duct (7) and motor fan means (10) for the generation and propagation of the flow in the duct (7). The machine comprises at least one additional drying compartment (13, 23) which is inserted in the circuit of the flow of cooling air of the condenser (4) in the section between the condenser (4) and the discharge opening (11, 41) to the environment outside the machine.
