Abstract (en)  
[origin: EP1925769A1] The device has a base fixed to the ground, and rollers cooperating with a gate. A transversal adjustment device is connected on the base and adjusts the rollers perpendicularly to a plane of an apron. A vertical adjustment device (208) vertically adjusts the rollers. The vertical device has a pedestal (306) that is attached on the transversal device and that rotatably moves with respect to the transversal device around a vertical axis. A mast (308) of the vertical device has a base (546) and an upper end connected to the rollers. The base and pedestal define vertical axis helical connection.
