Abstract (en)

[origin: WO2007030067A1] A device for holding a blister pack (42) with an array of cavities closed by a foil, which cavities contain an article, said device comprising a housing (8) for receiving said blister pack (42), which housing (8) comprises a base (9) provided with base openings (10) and is arranged to permit movement of said blister pack (42) between a first position and a second position, in which first position the base openings (10) are displaced from the cavities and the base (9) blocking the cavities, and in which second position the base openings (10) are aligned with the cavities, the base openings (10) permitting passage of said article therethrough. The device comprises a locking arrangement (12) comprising a operating means (13) operable by a user, between a locking position and a non-locking position, in which locking position the blister pack (42) is locked in said first position, and in which non-locking position the blister pack (42) is movable to said second position. Said operating means (13) are operable from the locking position to the non-locking position by a first movement of said operating means in relation to the housing, followed by at least one second movement of said operating means in relation to the housing. Further, a method for opening a cavity in a blister pack placed in said device.
