Abstract (en)
[origin: WO2007033777A1] The invention discloses an expedient embodiment, which can be adapted readily and is advantageous in many respects, of a compressing, condensing and bundling apparatus for fibre composites. It is aimed at apparatuses which have a suction opening (10) which interacts with a transporting and condensing member in the form of an endless, flexible, perforated apron (5). Supporting clips (13) which are preferably configured as plastic injection-moulded parts can be clamped at the pitch spacing of the workstations onto a profiled rail (12), by means of which the position of the perforated apron can be set with respect to the nip of the pair of delivery rollers of the drawframe.
