Abstract (en)

[origin: WO2007033814A2] The invention concerns a method for accessing, via a communication network (R), data concerning at least one user, in particular an identifier enabling said user to be contacted subsequently, and stored in a storage module (Bdp). The invention is characterized in that said method includes the following steps: a) transmitting, via said communication network, elements characterizing a user of at least one probe terminal and determined on the basis of traces of communications of said probe terminal with at least one server of said network; b) determining, based on said transmitted characterizing elements, at least one determined profile characteristic pertaining to said user; c) storing said at least one determined profile characteristic in said storing module (Bdp); d) creating a list of users including, associated with each of said users, at least one identifier for which said at least one profile characteristic stored at step c) corresponds to at least one profile characteristic defined in a request transmitted by a requesting user terminal: e) transmitting, via said communication network, to said requesting user terminal said list created at step d).
