Abstract (en)
[origin: WO2007033918A1] The invention relates to a cooking appliance, in particular, a cooking appliance which is mounted in an elevated manner, comprising a muffle (5) which defines a cooking chamber (3) and which comprises a muffle opening (6), a housing (1) for cladding the muffle, a door (7) which can be displaced for closing the muffle opening, a guide rod (10) which is used to guide and displace the door in relation to the muffle opening and electric and/or electronic components which are arranged inside the door and electric connection elements which are arranged between the electric and/or electronic components inside the door and connected to the housing. The electric connection elements are formed by cables (34), in particular, having strain relief (38), and at least one part of the cable is received via at least one part of the longitudinal extension thereof in a cable guide (36, 37), in order to enable a secure cable connection between the electric and/or electronic components in the door and the corresponding connections in the housing, without the cables being guided in an uncontrollable manner in a free chamber of the housing or rubbing against each other or against additional components inside the housing and as a result become worn.
