Abstract (en)

[origin: EP1930161A2] The method involves having a drive system sensing a turning angle as a reference value and a signal sequence (reference signal) with a machine control unit provided. The reference value is used as a basis of the control unit taking into account the turning angle of individual units of the processing machine as a reference value per unit generated. The machine control unit is verified whether the signal and the reference value signal from the respective modules in a control unit of the machines stored are for a given angle for a clutch position. An independent claim is included for a device for controlling a processing machine.
