Abstract (en)
[origin: DE102006057776B3] The method involves transporting an object (Se1) and another object in a row in a start direction (S-R), so that a gap is provided between them. The former object is diverted into a target direction (Z-R) and is transported again in to the target-direction. The sum of the thickness of the both the objects is determined, if the thickness sum is small or same of a specified thickness limit, which releases the continuation of the transport of the former object by guiding devices, and if the thickness sum is greater or same of the specified thickness limit. Independent claims are also included for the following: (1) a device for transport of double layered objects (2) an equipment for automatic stacking of double layered objects.
