Abstract (en)

[origin: EP1930535A1] The device has a connecting rod (B) placed under a lower horizontal hollow crosspiece (T) of a leaf (P), and connected to a screw/nut type actuator integrated to the leaf at a point. An end of the rod is connected to a fixed offset point (F), where the point is placed at a same distance from a median vertical plane of the leaf passing via a pivoting axis (XY) in closed or open position. The distance is defined to angularly move the leaf at 90 degree and determine a calibrated force of motorization of the leaf in opening and closing of the leaf to determine a maximum driving force on the end.
