Abstract (en)
[origin: WO2007036468A1] The invention relates to a method and system for operating a railway line, wherein a station control room (1) interacts with at least one device for intermittent automatic train-running control (6). In order to fulfil the safety requirements with lowest possible costs, the vehicle specific data (invKEY1, invKEY2) are transmitted by the station control room (1) to a data carrier which is located on the side of the railway, wherein said data is compared with data (KEY1, KEY2) of a traction vehicle (Tfz, Tfz1, Tzf2) when said traction vehicle (Tfz, Tfz1, Tzf2) overruns the data carrier and the device for intermittent automatic train-running control (6) is adjusted in such a way that the run is authorised when the data are in conformity and, otherwise, generates a danger signal and/or the train automatic stop.
