Abstract (en)

[origin: WO2007043988A1] A method and apparatus for optimizing viewing distance for a stereogram system. In a stereogram, an image (102) is held in close juxtaposition with a lenticular screen (101). In the invention, a data store is used to store optimum pitch values for specified viewing distances. An interdigititation program then acts on the table values and creates a mapping of interdigitated views for each viewing distance. The user can then select or specify a desired viewing distance and the optimum mapping of views is automatically chosen for display.
