Abstract (en)
[origin: EP1932957A1] The stopping process is for machines with components controlled in their movement towards each other by the magnitude of signals of the movement of a guide axis. The stopping process is initiated by a single release of a stop event, which is achieved by a controlled delay of the guide axis movement through intermediate positions until stopping is completed in relation to the defined stop position (S1, S2, S3, S4, S5, S6, S7) of one or more components.
