Abstract (en)

[origin: US2008302878A1] In a method for regulating an air-conditioning system of a vehicle whose top is open, air whose temperature and mass flow rate are regulated as a function of at least the control variables of the setpoint temperature of the passenger compartment and the actual temperature of the passenger compartment being fed to a passenger compartment of the vehicle via a plurality of vent openings. The speed of the vehicle is measured and, when it increases, the air-mass flow rate, which is fed to the passenger compartment through vent openings at lower positions, is reduced and the air-mass flow rate, which is fed to the passenger compartment through vent openings at higher positions, is increased.
