Abstract (en)

[origin: US2007080090A1] A child-resistant medicament storage and distribution back card for senior-friendly and child-resistant distribution of a medicament. The back card is incorporated into a medication package where it protects the area of the package that is most susceptible to attacks on the integrity of the package. The back card has a card opening feature bounded by a perimeter that includes at least two cuts and at least two lands, often thought of as perforations. The cuts extend through the back card, and the lands connect the back card to the card opening feature. Each cut has a cut length and each land has a land length. The ratio of any land length to any cut length is between approximately 0.25 and approximately 0.80, which has been found to substantially prevent removal of the card opening feature from the back card by picking at any of the cuts with a fingernail
