Abstract (en)

[origin: EP1775383A1] The method involves providing a bridging plate (17) that spans an expansion joint (3) and an opposing plate (20). The opposing plate meshes with the bridging plate in an area of a finger arrangement (21) that is located in an area of a recess, where the bridging plate is able to be repeatedly removed and re-assembled. The recess is placed at a lower level than a lane surface in a zone that borders a bridging device.
