Abstract (en)

[origin: WO2007023353A1] A discharge lamp (11) is described, in particular power supplied with direct current, comprising: a socket (12); a first tubular portion (13) surrounding a first electrode (14) having a first end (14A) and a second end (14B); a bulb (15) made of a transparent material and containing high-pressure gas, the first end (14A) of said first electrode (14) and a first end (15A) of a second electrode (16); a second tubular portion (17) surrounding said second electrode (16) and extending from the bulb (15) in a direction substantially opposite to said first tubular portion (13). The main feature of the invention consists in the fact that a second end (16B) of said second electrode (16) is connected electrically to said socket (2) through a plurality of wires 18, which are electrically connected in parallel to one another.
