Abstract (en)

[origin: WO0240787A1] The invention relates to a distributing device for distributing fluids containing active ingredients to the flush liquid in a toilet bowl. The device comprises a holder (1) that can be suspended from the edge of the toilet bowl and at least two separate storage containers (2, 3) for a fluid containing active ingredients that are arranged in the holder (1), wherein each storage container (2, 3) has its own outlet (4) by means of which the respective fluid containing active ingredients is distributed to the flush liquid. In order to optimize the possibility to control the distribution of the fluids containing active ingredients in existing distribution devices, the storage containers (2, 3) are protected in such a way that no flush liquid can enter inside said containers. The outlets (4) of the storage containers (2, 3) are arranged in such a way that only the fluid containing the active ingredients can come out. A partial amount of fluid containing active ingredients is distributed from each storage container (2, 3) to the flush liquid each time the toilet is flushed.
