Abstract (en)

[origin: DE102007022311A1] The unit (12) has a bearing part axially fixed in a recess of a supporting profile (1). The bearing part is rotatably mounted to safely receive information transmitted from a supporting profile wing load and attached to a bearing pin on a threaded connection. The bearing part and the bearing pins are arranged along a common axis. Bores are aligned with each other for retaining rod-shaped elements (7), which form frictional connection, spring-loaded and fixed connection between the bearing pin and the bearing part. A bearing washer is made of a wear-resistant plastic material.
