Abstract (en)
[origin: EP1936098A2] The system (1) has a door e.g. sliding door, leaf (3) movable by a driving device (2), and safety devices (6, 7) absorbing impacts, which are developed during impinging of the leaf to an obstacle found in its movement area. The safety devices have a unit designed in a gradual impact energy absorbing manner. The impact-absorbing unit of the safety devices exhibits rest elasticity for reaching an initial position after one impact, where the safety devices exhibit two areas with hardness differing from each other. A switching device is operable by contact of the areas of the safety devices.
