Abstract (en)
[origin: FR2889171A1] The dispenser has a flexible pouch containing a pressurized fluid product and arranged in a rigid outer canister to define an intermediary space to be filled with pressurized gas. A valve (3) has a valve stem (32) and a mobile cap (34) operable to allow the product to distribute via an outlet (321) of the valve. A closing unit (5) closes a passage between the pouch and the outlet independent of pressure at the level of the outlet and actuation of the stem and the cap. The pouch has a support mounted in an axially movable manner with respect to a valve body for moving the closing unit. An independent claim is also included for a method of filling a fluid product dispenser.
