Abstract (en)

[origin: WO2007041374A2] A probe instrument having a probe that interacts with a sample surface to perform a mechanical property measurement at high speed includes a scanner producing relative motion between the sample and the probe. In addition, a probe actuator produces relative motion between the sample and the probe, in a generally vertical direction, and a controller that generates a scanner drive signal and an actuator drive signal. The probe actuator is responsive to the actuator drive signal and has an operable bandwidth of at least about 50-80 kHz to perform the fast force curve measurements. The probe actuator is preferably located at least partially on the cantilever. Moreover, feedback during normal operation may be interrupted to perform a force curve measurement with the integrated actuator.
