Abstract (en)

[origin: DE102005048746B3] The method tests an entire set of rail vehicle wheels (12) including at least one axle with wheels attached to the ends. A wheel (16) is brought into rolling engagement with a rail ring (22). The impact angle of the wheels relative to the ring is varied to simulate the operating stress of the axial and/or radial forces acting on the wheel. Independent claims also cover apparatus for carrying out the method.
