Abstract (en)  
[origin: EP1939123A1] The present invention provides a textile machine capable of grasping states of operating units with high accuracy. A winding unit 2 of an automatic winder includes antennas 35 which acquire verification information from IC tags 40 to 43 provided on a yarn supplying bobbin 4, a winding tube 7, a splicing device 14, and a fluff suppressing device 13, and transmits the verification information to a unit controller 32. A host controller 31, which monitors and controls a plurality of winding units 2, determines whether the IC tags 40 to 43 of each winding unit 2 are regular based on the information acquired by the antennas 35. When a determination is made that at least one of the IC tags 40 to 43 is not regular, the host controller 31 outputs a signal for prohibiting yarn winding to a corresponding winding unit 2.
