Abstract (en)
[origin: EP1942268A2] Varying the fan nozzle flow area in a gas turbine engine 1 allows adjustment of the bypass flow for varying operational conditions such as cruise and take off. However, care must be taken with regard to variation in order not to introduce drag or operational susceptibility to failure. By provision of a deformable member having a contiguous surface 4, 14, 54 which is deformed laterally from a splitter such as a pylon 5, 15, 55 variation in flow area is achieved. A deformable member 4, 14, 54 will be secured through seals 18, 58 to ensure a smooth surface. Actuation may be through a shape memory alloy material or provision of mechanical actuators 10 to cause deformation of the contiguous surface 4, 14, 54.
