Abstract (en)
[origin: US2007062166A1] An apparatus for creating cuts or scores in a substrate includes a support structure, one or more blades and a secondary support. The support structure has one or more cavities, which collectively define a substantially planar reference surface. Each blade has a cutting edge, which contacts the substantially planar reference surface, and each blade is biased against the substantially planar reference surface. An opening is defined through the substantially planar reference surface of the support structure to expose a portion of the cutting edge of each blade. The secondary support is capable of holding a portion of the substrate between the secondary support and in contact with the exposed portions of the cutting edges of the blades.
