Abstract (en)
[origin: WO2007051478A1] Disclosed is a method for radio broadcasting a plurality of different information offers in a terrestrial mutual broadcasting
system (1) on a common channel with radio broadcast signals in a time slot process. According to said method, at least one transmission time slot
is allocated to each information offer in order to radio broadcast the information offer, a radio broadcast signal is provided with a plurality of global
time windows with at least one respective transmission time slot over time, and the radio broadcast signal is transmitted by a plurality of spaced-
apart transmission devices (3) in such a way that the global time windows of the radio broadcast signals transmitted by the transmission devices
(3) contain the same information offers while the allocation of the transmission time slots of the global time windows is identical with the information
offers. According to the invention, the radio broadcast signals are also provided with local time windows with transmission time slots which are
allocated to local information offers, radio broadcast signals transmitted with identical information offers in the global time windows by at least two
spaced-apart transmission devices (3) on the same channel being provided with different information offers in local time windows.
