Abstract (en)
[origin: EP1943917A2] The clasp has an elongated plate (27) connected to an unfolding element (12). A movable carrier (26) is mounted on the plate using lateral guide rails (30, 31) in a sliding manner. The carrier carries a pin (36) elastically solicited against a part (37) of the plate to determine shortened and elongated positions of the clasp and a bracelet. An activating unit (50) i.e. slider, is acted on the pin to disengage the pin from the part for allowing movement of the carrier on the guide rails. The carrier has a fixation component (40) i.e. pinch clip, to fix a strand of the bracelet to the carrier.
