Abstract (en)
[origin: WO2007051330A1] The invention relates to an injection device, especially an automatic injector, comprising a) a switching element (1) that can be displaced approximately along a longitudinal axis (L) of the injection device, from a starting position into a release position via a coupling position, and b) a triggering element (3) that can be displaced transversally, especially perpendicularly, to the longitudinal axis (L), c) the switching element (1) comprising a control surface element (4), and d) the triggering element (3) sliding along the control surface element (4), at least during the movement of the switching element (1) from the starting position into the coupling position,.
