Abstract (en)

[origin: FR2891468A1] The snow-shoe (1) has a boot holder in the form of a plate (7) that pivots about a transverse axis close to its forward end so that the angle of the plate and boot (5) can be set according to the slope of the ground being traversed. The underside of the plate has at least one projecting crampon (14a, 14b), preferably of metal towards its rear end, and it is held in the required position by an adjustable sliding stop (11).
