Abstract (en)
[origin: WO2007048906A1] The invention concerns a secure package (1) for drugs, characterized in that it comprises means for blocking access to the drug such that, to gain access to the drugs, the user must execute two simultaneous actions, whereas when one of the actions is interrupted access is rendered impossible and in that it consists of a case (2), a blister (3) and an elastic system. The blister (3) being a card pack for dispensing pills. The blister (3) is mobile and can be moved in translation in the case (2) by being slid on the base. Thus, the blister can take up two positions, namely an initial rest position, wherein the position of the cells does not correspond to the holes formed in the base wall and a so-called active position, wherein the cells are in a position corresponding to the holes in the base wall.
