Abstract (en)

[origin: WO2007051613A1] The invention relates to a disc brake, in particular for a commercial vehicle. Said brake comprises a brake calliper (1), which has a receiving chamber (13) for an application device and which encloses a brake disc, against which brake linings (2) can be pressed during a braking procedure and a retaining bracket (4), which is detachably fixed to the brake calliper (1) and on which lining retainer springs (3) that act on the outer edges of the brake linings are supported. Preferably, one end of the retaining bracket (4) is connected to the brake calliper (1) and the other end is held by a securing element (6). The disc brake is configured in such a way that the securing element (6) is inserted into at least one cavity of the brake calliper (1) in the longitudinal direction of the retaining bracket (4) and lies against at least one buffering edge (8) of the retaining bracket (4), secured against displacement in the insertion direction.
