Abstract (en)

[origin: WO2007051616A1] The invention relates to a disk brake, especially for a commercial vehicle, comprising a caliper which comprises a brake disk, is fixed to a brake anchor plate (1), and contains at least one clamping device. During a braking process, the clamping device presses a brake lining (3), which consists of an anchor plate (4) and a friction lining (5) and is mounted in the brake anchor plate (1) in a displaceable manner, against the brake disk, the course of displacement of the brake lining (3) being defined by at least one end abutment (8) of the brake anchor plate (1). The inventive disk brake is embodied in such a way that the friction lining (5) comprises a recess (9) associated with the end abutment (8), said recess passing over the end abutment during the displacement of the brake lining (3).
