Abstract (en)

[origin: WO2007055439A1] An apparatus and method for transmitting minimized traffic information through a digital broadcasting network are provided. The apparatus includes: a database classifying traffic status into traffic information indexes including areas, road codes indicating roads in the areas and average car speeds measured on the roads, and storing the classified traffic status; a traffic information classifier classifying the traffic status stored in the database based on the average car speeds measured on the roads and the numbers of roads on which the respective average car speeds are measured; a code generator applying variable length coding (VLC) to the traffic status classified by the traffic information classifier and generating speed codes corresponding to the average car speeds using VLC based on the number of roads; and a message transmitter generating a traffic information message including one or more road codes per one or more areas based on the traffic information index, average car speeds corresponding to the one or more road codes, and a speed code table including the average car speeds, and transmitting the traffic information message.
