Abstract (en)

[origin: EP1946686A2] The separation wall has a door element (2) and a hinge (8), where hinge parts (10,12) are mounted on the door element and on a wall element (4). The door element is vertically pivoted around a predetermined pivoting axis by the hinge. An opening of the separation wall is locked by the door element in a position, where the opening is partly released in another position. A lifting device is integrated with the support element and a pressure-exerting element in the hinge. The door element is lifted upwards in a vertical direction during the deviation from the former position.
