Abstract (en)

A play simulator is provided which comprises a first determination unit adapted to determine an index value of quality by combining a predetermined target difficulty level and a given level of playing ability of a player, a receiving unit adapted to receive parameters of an action of the player, a second determination unit adapted to determine at least one actual value of the action depending on the received parameters, and a calculation unit adapted to calculate an actual quality-value by associating the index value of quality and the at least one actual value of the action. In particular, the play simulator may be a golf play simulator.
