Abstract (en)

[origin: EP1946990A2] The method involves receiving an activating signal by a switch controller (2) coupled to a electrically position-adjusted switch (1) e.g. palm button control switch, by a detector upstream to a pointed side of the switch, where the activating signal indicates driving. A switch adjusting command is received by the switch controller over a wireless interface and is switch-independent. An adjusting signal is transmitted from the switch controller to the switch, and a radio interface is utilized as a wireless interface, where the adjusting signal triggers adjustment of the switch.
