Abstract (en)
[origin: EP1947043A1] The winding device has a winding shaft acceptance device has two winding shaft acceptance stations (5,6). A pivoting drive is provided for the winding shaft (3), which is independently displaceable between the start winding position and the withdrawal position. The winding shaft acceptance stations accept an alternate current winding shaft. The different winding shaft acceptance stations are displaceable into an inserting position to the insertion of a new winding shaft between the start winding position and the withdrawal position. An independent claim is also included for a method for arranging a winding shaft change in a winding device for rolling a continuously approaching material channel on a winding shaft under formation of a coil of the material channel on the winding shaft.
