Abstract (en)

[origin: US2008209765A1] The shoe, has a shoe upper part and a sole. The sole has a supporting part, which is designed for receiving the heel region of the wearer's foot and is connected to the shoe upper part, and a sole element, which is connected to the supporting part. In order to improve the damping behavior of the shoe, the supporting part and the sole element are spaced apart from each other, in the longitudinal direction of the shoe. The connection between the supporting part and the sole element is preformed at two spaced-apart points in such a way as to form, under the heel region of the wearer's foot, a gap. The gap extends at least in portions over the entire width of the sole. The sole element, in the rear end region of the shoe, is connected to the supporting part.
