Abstract (en)  
[origin: US8459531B2] A container (1) for storing and removing food comprises a first and a second container half (2, 3) which are connected to each other by means of a pivotable connection in order to pivot between an open position (4) and a closed position (5). To improve such a container to the effect that it is also suited for the consumption of the food and can be simultaneously produced more stably and economically while it is easy to assemble, each container half (2, 3) comprises an upper and lower polygonal container wall (7, 8; 9, 10), when seen from above, and a lateral wall (11, 12) which connects the walls at a distance in relation to each other, wherein the pivotable connection is embodied by a pivotable line embodied between facing first ends (13, 14) of the lateral walls (11, 12), and the second ends (15, 16) of the lateral walls (11, 12) are in the closed position (5) detachably connected to each other, wherein the pivotable axis (17) associated to the pivotable line (6) extends essentially perpendicular to the upper and lower container walls (7, 9; 8, 10). Moreover, a single-pieced blank (60) is provided for producing such a container (1).
