Abstract (en)  
[origin: US2009032575A1] A container (1) for the transport of a foodstuff comprises an upper and a lower container half (2, 3) which are interconnected for pivoting between a closed and an open position (4). Each container half comprises a flat bottom and/or cover wall (5, 6), from which side walls (7, 8, 9, 10) extend essentially obliquely upwards or downwards and outwards to the respective other container half (2, 3). In order to improve the thermal insulation with containers of this nature and at the same time to achieve increased stability, in particular with containers made from paper, cardboard or the like, the bottom and/or cover wall (5, 6) is formed double-walled at least in places. A one-part blank (40) is provided for the manufacture of a container of this nature.
